<b>Description</b>		
<p>Open a composer and add two or three maps.</p> <p>Then, add a scale bar or a legend. These items have a property named Map which helps to set to which map in the composition they should rely.</p> <p>But there is no way to directly know the name of the maps (which one is map1, map2 or map3?). The only way i found is to check in the Overview properties of the map, which map name is missed in the list.</p> <p>That become hard when you have many pages in your composer.</p> <p>It would be nice at the top of the properties of a map to have its name displayed.</p>
