

QGIS Application - Feature request #11084

Group feature subset - apply filter expression to a group of layers

2014-08-21 02:03 AM - Mike Taves

Status:	Open	Resolution:  Copied to github as #: 19417
Priority:	Normal	
Assignee:		
Category:	Expressions	
Pull Request or Patch supplied:	Yes	
Easy fix?:	No	
Description		
<p>This is a feature request to apply a feature subset using a filter expression on a group of layers.</p> <p>It would be accessible using the Group context menu in Layers, and this feature is very similar to the "Set Group CRS" item currently available in QGIS 2.4.0.</p> <p>The limitation of this feature is that all layers within a group need to be filtered using the same filter expression. For example, if a group of layers consists of multiple shapefiles, and the filter expression was "name"='Bob', all layers in the group must have a feature attribute "name". Layers that cannot use a group filter expression should log an error and/or not be filtered with the expression.</p> <p>The current method is to modify the filter expression for multiple layers using the GUI, which can be time consuming if there are many layers.</p>
