Crashes QGIS or corrupts data:	Copied to github as #: 19535
Description	
Problem Description: Removing a Join from layer properties is completed even when user cancels the property window.	
Expected Behavior: Canceling a layers property window should cancel all changes.	
Problem Result: The user must re-enter the join(s).	
Steps to reproduce: Open Qgis Add a vector layer. Add a second table to join. Open layers properties window. Select Joins tab. Add a join and OK or Apply. Close properties. Re-open layer property window. Select Joins tab. Remove Join. <u>Cancel</u> Layer Properties. <i>Open layer Properties, join is now gone.</i>
