

QGIS Application - Feature request #12474

Automate label rotation within polygon

2015-03-29 09:20 PM - Jesse McMillan

Pull Request or Patch supplied:	invalid	Resolution:
Easy fix?:	No	Copied to github as #: 20622
Description		
<p>ArcGis has a label placement option "always straight" that automatically rotates the labels within polygons for the best fit. This is especially useful for parcel numbers around the ends of cul-de-sacs, and parcels that are tall and narrow.</p> <p>I know I can manually rotate each label, but I maintain a map with over 6000 labeled parcels and it would be extremely time consuming. A feature to automate this would be excellent.</p>

Hi,

"Free (slow)" option of polygon labeling looks like what you need. It can indeed be very slow. Do you confirm this works as expected?

Wow, can't believe I didn't notice it was already implemented. Thank you.

I will say, the label locations aren't quite as consistent as arcgis, which could perhaps be improved.

However, QGis does a better job labeling as many polygons as possible (where arcgis leaves some blank.)

noticed the attached image for a comparison.

In any case, it works for me. Thanks again.
