

QGIS Application - Feature request #12939

make the field calculator compute areas and lengths in units other than map units.

2015-06-11 05:49 AM - baditaflorin -

Status:	Closed	Resolution: Copied to github as #: 21019
Priority:	Normal	
Assignee:		
Category:	Field calculator	
Pull Request or Patch supplied:	No	
Easy fix?:	No	
Description		
<p>For now, you need a faculty and a degree to find out a simple thing, how many kilometers or meters does a way have.</p> <p>Using field calculator you will find out using \$length the length in arc degrees, or the default CRS</p> <p>The measure tool allows me to see the results in meters, without having to search half of the Internet for a projections that will fit my specific CRS that I should find for Mexico, only to go and work something in Australia, and then i will need another CRS there, because they will not be compatible.</p> <p>Why not implement something simple. 2015 style, like \$length_km \$length_nautical_mile \$length_mile</p> <p>and if i will use the standard length it will be the CRS conversion, but 95% of the time, i don't want the CRS conversion, because what would be the advantage of knowing that the road is 0.000043 Arc meters? I am sure somebody wants to know, but i think the majority of people are using wsg84 but they don't care about arc meters, they want to know if that road is 430 meters, or not.</p>

Associated revisions

Revision 9f772bce - 2016-02-13 01:36 AM - Nyal Dawson

Add API call for setting preferred distance unit for QgsExpression

(refs #13209, #12939, #4857)

Revision ddbdcf8a - 2016-02-14 11:04 AM - Nyal Dawson

Fix project unit confusion (pt 2): add project distance unit setting

Adds a new option in project properties to set the units used for distance measurements. This setting defaults to the units set in QGIS options, but can then be overridden for specific projects.

The setting is respected for length and perimeter calculations in:

- Attribute table field update bar
- Field calculator calculations
- Identify tool derived length and perimeter values

- Default unit shown in measure dialog

Also adds unit tests to ensure that length and perimeter calculated by attribute table update bar, field calculator and identify tool are consistent wrt ellipsoidal calculations and distance units.

(refs #13209, #12939, #2402, #4857, #4252)

Revision dfdcec89 - 2016-02-15 02:47 AM - Nyal Dawson

Fix project unit confusion (pt 3): add area unit settings with a ton of available area units (eg m2, km2, mi2, ft2, yd2, ha, ac, etc)

Adds a new option in both the QGIS setting and project properties to set the units used for area measurements. Just like the distance setting, this defaults to the units set in QGIS options, but can then be overridden for specific projects.

The setting is respected for area calculations in:

- Attribute table field update bar
- Field calculator calculations
- Identify tool derived length and perimeter values

Also adds unit tests to ensure that area calculated by attribute table update bar, field calculator and identify tool are consistent wrt ellipsoidal calculations and area units.

TODO: make measure tool respect area setting

(refs #13209, #4252 and fixes #12939, #2402, #4857)

afaik values are computed in layer CRS, once you know is not difficult to keep it in mind. Values are always in map units (meters, feet, degrees), so for instance computing KM is not that hard... $\$length/1000$.

Said that I agree that the field calculator should have functions to compute values in units other than meter/feet more "easily".
