Description

When Linux decided to upgrade me to the 2.10 candidate, I could no longer select a bunch of style entries in a symbology dialogue and right-click on the lot to "change width" of the line. I could still change transparency, colour, map unit, everything but width. You can change the number and hit APPLY, but nothing happens and when you right-click and pick "change width" again a moment later, it's still showing the same width.

This is of a linear (linestring) feature type with "categorization" picked and several different coloured lines, all the same width, in the style depending on a variable (the material type of the pipe, these are water pipes).
