QGIS Application - Feature request #1324
Identify on multipoint layer displays useless derived x and y values

2008-09-21 06:55 AM - Steven Mizuno

Status:	Closed		
Priority:	Low		
Assignee:	Magnus Homann		
Category:	Vectors		
Pull Request or Patch supplied:		**Resolution:**	fixed
Easy fix?:	No	**Copied to github as #:**	11384

Description

When Identifying a multipoint object the results window shows derived values x=0 and y=0 which is meaningless.

Consider not displaying anything. Alternatively, display component points' x,y values, but this is not a good idea when there are more than a few component points.

Can you provide a sample multi-point vector, please?

The shapefile in the .zip archive contains a few points near 500000, 5000000 in epsg:26915. This was exported from [[PostGIS]].

I have attached a patch that ensures that multi-line and multi-point features do not show any derived information in the identify tool.
