Pull Request or Patch supplied:		**Resolution:**	
Crashes QGIS or corrupts data:		**Copied to github as #:**	22791

Description

Hi

First issue:

While Save a Raster As a GeoTiff

Choosing Rendered Image and VRT

Browse for filename you have to choose a folder. In the dialog the folder are named with an extension '.tif'

This result in a new folder with the images, and the chosen folder is empty.

Solution: Just remove the '.tif' manually

If you don´t choose the VRT everything is OK

Second issue:

Saving in the original pixelsize. The saved image are placed incorrect. Just a few meters north. If changing resolution from 0,1 to 0,2 the incorrect placement direction is headed North East.

Regards

Lene Fischer

History

#1 - 2016-05-23 01:28 PM - Giovanni Manghi

- Operating System deleted (Windows 64 bit)

- Priority changed from High to Normal

- Status changed from Open to Feedback

- File googlegeo.tif added

The first issue is duplicate of #14171

Regarding the second issue: I get a small shift only if I choose "map view extent" instead of "layer extent" (same resolution as the original raster), and that is somehow expected in my opinion. Attached my small sample data.

#2 - 2016-07-03 12:40 AM - Giovanni Manghi

- Status changed from Feedback to Closed

Closing for lack of feedback (about the second issue), please reopen if necessary.
