<b>Easy fix?:</b>	No	<b>Copied to github as #:</b> 23195
<b>Description</b>  I already tried 2 extensions that were supposed to perform this feature : - relocater - consolidate  but none of them worked  It would be nice to have a feature when you want to package all your current QGIS project in order to share it with someone else (by email for instance). The person who will receive this package should obviously have QGIS installed on its computer.  As a .qgs file is currently linking to the real data file's path(s), it can't be done for the moment as sending the .qgs won't solve the problem of missing data files or wrong data files paths. And if you make a zip file with your .qgs file and your data files as well, and send the zip file to someone else : the paths to the data files could be wrong on the receiver's PC.
