Pull Request or Patch supplied:	No	**Resolution:**	
Crashes QGIS or corrupts data:	No	**Copied to github as #:**	23205

Description

I have a case with a SQLite dataset containing two layers. A line layer and a polygon layer. Both layers have attributes with values. I have opened both layers in QGIS.

- When performing a *identify features* on features in the two layers the result looks fine.
- When opening the *Attribute Panel* on either of the layers all values are NULL.

I would expect the *Attribute Panel* to display the correct attribute values of all the features and not just a collection of NULL's.

I produced this in MASTER (3d72837) using the attached SQLite test dataset. I have also reproduced this in 2.14.1.
