

QGIS Application - Bug report #1531

Georeferencer GDAL crashes QGIS

2009-02-06 02:00 AM - Horst Düster

Status:	Closed	
Priority:	Low	
Assignee:	Maxim Dubinin	
Category:	C++ Plugins	
Affected QGIS version:		Regression?: No
Operating System:	Debian	Easy fix?: No
Pull Request or Patch supplied:		Resolution: worksforme
Crashes QGIS or corrupts data:		Copied to github as #: 11591
Description		
<p>The new Georeferencer GDAL plugin crashes QGIS when you try to reference a just created modified image a second time without closing the plugin.</p> <ol style="list-style-type: none">1. Start Georeferencer2. Load image3. add point4. select polynomial 25. create and load layer <p>It works fine. When I repeat sequence 3.-5. without closing georeferencer QGIS crashes.</p>

I'm not sure understood it completely.

Do you mean we should check if the resulting raster is already loaded in the Legend?

#2 - 2009-07-13 03:31 AM - Giovanni Manghi

I'm not able to reproduce the problem, also probably because I'm not understanding very well the description.

If you select "polynomial 2" you need at least 6 points. If you select less, qgis warns you and do not let you make the transformation. It takes a while to produce the transformed image but eventually it makes it.

I don't see any particular problem when I open a new image to georeference or if I open the same (qgis warns you that a world file already exist).

Please give further feedback.

#3 - 2009-07-19 01:28 AM - Giovanni Manghi

- Resolution set to worksforme

- Status changed from Open to Closed
