

QGIS Application - Bug report #16065

IDW and TIN interpolation errors in Processing

2017-01-12 02:06 AM - matteo ghetta

Status:	Closed	
Priority:	Severe/Regression	
Assignee:		
Category:	Processing/QGIS	
Affected QGIS version:	master	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:		Resolution: fixed/implemented
Crashes QGIS or corrupts data:		Copied to github as #: 23980
Description		
It seems that there are some issues with both the IDW and TIN (of the QGIS -> Interpolation menu) interpolation in Processing. With all the data I tried (custom data, see attach, or default test data in the processing folder: QGIS/python/plugins/processing/tests/testdata/points.gml) there are some errors and suggestion I'd like to made: Errors: IDW and TIN - if no extend is selected, Processing automatically choose the min extent of the input layer. The following error appears: 2017-01-12T10:56:04 2 Uncaught error while executing algorithm Traceback (most recent call last): File "/home/matteo/lavori/QGIS/build-qgis3/output/python/plugins/processing/core/GeoAlgorithm.py", line 216, in execute self.processAlgorithm(feedback) File "/home/matteo/lavori/QGIS/build-qgis3/output/python/plugins/processing/algs/qgis/ldwInterpolation.py", line 148, in processAlgorithm extent = self.getParameterValue(self.EXTENT).split(',') AttributeError: 'NoneType' object has no attribute 'split' - even with a canvas, manually entered or secure extent fetched from the source layer (no OTF), the interpolation might work, but min/max values are always 0 (tested with the data in attach, T_MAX value) only TIN: - with the attached data, and the attribute T_Max, cell size 10000 and extent fetched from canvas or layer the following message appears, the output is created with 0 min/max values: AttributeError: 'AlgorithmDialogFeedback' object has no attribute 'reportError' Traceback (most recent call last): File "/home/matteo/lavori/QGIS/build-qgis3/output/python/plugins/processing/gui/AlgorithmDialog.py", line 210, in accept self.finish() File "/home/matteo/lavori/QGIS/build-qgis3/output/python/plugins/processing/gui/AlgorithmDialog.py", line 231, in finish if not handleAlgorithmResults(self.alg, self.feedback, not keepOpen): File "/home/matteo/lavori/QGIS/build-qgis3/output/python/plugins/processing/gui/Postprocessing.py", line 90, in handleAlgorithmResults feedback.reportError(msg) AttributeError: 'AlgorithmDialogFeedback' object has no attribute 'reportError'		

Features:

- default cellsize is 0, that might confuse the user because if the algorithm is run with 0 cellsize, output is created but it is an empty tif file. Could it possible to load some default cellsize or (maybe better) pop-up a window is the cellsize is = 0?

History

#1 - 2017-01-12 05:07 AM - Giovanni Manghi

- Assignee deleted (Alexander Bruy)
- Priority changed from High to Severe/Regression

if issues are confirmed this need to be taken care in time for qgis 3, so raising the priority.

#2 - 2017-01-12 06:02 AM - matteo ghetta

Hi Giovanni. Is there another way to raise the priority in addition to change the priority level in the ticket?

#3 - 2017-01-13 05:49 AM - Alexander Bruy

- Operating System deleted (Linux mint)
- Status changed from Open to Closed
- Resolution set to fixed/implemented
- OS version deleted (sarah)

Processing part fixed. Please, in future create separate ticket for each issue, don't put different problems in one ticket.

BTW, Processing interpolation algorithms already covered with tests, so there is no need to create new tests for them.

#4 - 2017-01-13 05:57 AM - matteo ghetta

Hi Alex, thanks for the fix!

However, if there were already tests for these algorithm why did they missed up?

Isn't the purpose of the test to make algorithms solids so that they cannot be broken?

Thanks again for your time!
