QGIS Application - Bug report #16678

Locator Filters option: Resizing the columns in the frame behaves weirdly

2017-06-07 12:53 PM - Harrissou Santanna

Status: Feedback

Crashes QGIS or corrupts data: Copied to github as #: 24577

Description

I guess a screencast would be more explanatory but I fail to find a proper way to do it in my current PC (or if someone else can confirm and make it...).

In the settings --> Options --> Locator, locator filters, you can't just select the vertical separator between two columns and move it to the right or the left to reduce/enlarge the adjacent columns; eg resizing the first columns is instead done by moving the separator between the second and third columns. The first separator can't be selected.
