

QGIS Application - Bug report #16916

Data Source Manager / Browser gives a message for every source that does not have crs info

2017-07-22 12:02 PM - Richard Duivenvoorde

Status:	Feedback	
Priority:	Normal	
Assignee:		
Category:	Browser	
Affected QGIS version:	master	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:	No	Resolution:
Crashes QGIS or corrupts data:	No	Copied to github as #: 24815
Description		
<p>Not sure if this is by design, but if I use the Browser and have a directory with some data files without crs info (shapefile without the .prj file), I get every time(!) I select that file, I get the message CRS was undefined: defaulting to project CRS....</p> <p>Going to another file and going back I have it again for the same file, WITHOUT even loading it!</p> <p>Off course I understand to read the metadata which is shown nowadays in the browser you have to load the data, but I think it is overkill to see this message when browsing.</p> <p>Would it not be better to only show it when it is actually loaded?</p> <p>OR (in my view) even better, do not show it in the messagebar so loudly, but just show it in the browser-metadata!</p> <p>I would even be in favour to retire this message anyway, because it pops up also when you load a GML file via the python interface etc. I see it to often, and have to tell people: don't worry... bla bal</p>		

History

#1 - 2017-07-22 01:55 PM - Giovanni Manghi

Weird, just updated master with osgeo4w and this does not happen. I would have bet that this was a consequence of the general options in "CRS > CRS for new layer", something that by the way bugs a lot when loading an image in the georeferencer (that of course has no CRS).
