

QGIS Application - Bug report #17157

Georeferencer seems properly not to close the opened file handle after closing georef window, open a new file, even create new or open another project.

Status:	Open	
Priority:	Normal	
Assignee:		
Category:	C++ plugins/Georeferencer	
Affected QGIS version:	3.4.4	Regression?: No
Operating System:	Windows 10 64-bit	Easy fix?: No
Pull Request or Patch supplied:		Resolution:
Crashes QGIS or corrupts data:		Copied to github as #: 25056
Description How to reproduce: 1. Open Georeferencer. 2. Open a raster. 3. From this point, the file handles stay held forever until application exits. <ul style="list-style-type: none">- Reset georeference/open another file/close window/new project: don't affect existing of file handles.- One can not move/rename/write the file. This can be considered a minor pet peeve, when you want to move things around after that. Suggestions: Release file handle on <ul style="list-style-type: none">- menu command- close georeferencer window would be convenient.

I confirm that QGIS 3.4.4 is still affected with this no-closing-file georeferencer issue.

Once a file get open in georeference. You can not modified the file until the whole application exits.
