Crashes QGIS or corrupts data:	Yes	**Copied to github as #:**	26821

Description

Hello,

For my job, I use QGIS on a Tablet PC equipped with a GPS to know my position on field.
With QGIS 3, when the GPS is activated (the cross indicating my location is displayed on the map), QGIS crashes when I try to move the map.

Can you make something please ?
Thanks a lot !
Benoit D.

- Subject changed from Unable to move the map when GPS is activated to Crash when panning map while GPS is activated

Thank you for reporting this.

Do you have the information from the "Oops" dialog available?
For best feedback, it would be great if you could install qgis-dev and qgis-dev-pdb from OSGeo4W to collect and provide this information.
