Easy fix?:	Yes	Copied to github as #: 26826
Description		
use variable in layer source		
We using qGis layer and can not use variable in source. We would use this feature for authentication. User can add project variables and then this variables can be used in layer source (connection)		
Example dbname='pvz1' host=biomon.com port=5432 user=@user password=@password sslmode=disable key='pkuid' srid=3346 type=Point table="public"."dirvinis_sejikas" (geometrija) sql=

A better solution is to use the authentication system with basic authentication:

https://docs.qgis.org/2.14/fr/docs/user_manual/auth_system/auth_overview.html

Change the id of the authentication with something like **0000000**

Your layer source should be :

dbname='pvz1' biomon.com port=5432 sslmode=disable authcfg='0000000' key='pkuid' srid=3346 type=Point table="public"."dirvinis_sejikas"
(geometrija) sql=

Do this on every client.

Best regards,
