Related or same issue on Windows 10, QGIS 3.0.3, code revision 8a899c8758.

Database Styles Manager reports "No styles found in the database" under "Styles related to the layer" for Spatialite layers even immediately after having saved a style for the layer.

This is more serious than the recurring concern about default styles not loading properly. I am unable to load any newly saved style. They simply do not appear in either list of styles within the database styles manager.

Steps to repro:

1) Load a multi-point geometry spatialite layer

2) Change symbology in any notable way

3) Save style in database with name TEST POINT

4) Open Database Styles Manager

- 5) Observe that TEST POINT style not shown in either list
- 6) Repeat steps with multi-polygon geometry layer using TEST POLY for style name
- 7) Observe that TEST POINT style shows in "Other styles on the database", but TEST POLY shows in neither list
- 8) Return to properties for multi-point layer
- 9) Observe that TEST POLY style appears in "Other styles on the database", but TEST POINT shows in neither list

#2 - 2018-07-02 10:54 PM - Whit Alexander

Reproduced in Bonn. Confirmed not an issue in Las Palmas.

Reproduced with new spatialite DB.

Perhaps I should log this as a new issue as it's not Linux and goes well beyond the impact suggested by the original subject. Styles database manager effectively unusable within spatialite it seems.

Please consider escalating priority of this issue.
