Crashes QGIS or corrupts data:	No	**Copied to github as #:**	27079

Description

Using the "Identify Results" tool, right-click on the canvas, you'll be prompted with the list of overlaid features.

This is only true if you have the "identify features by area or single click" tool enabled at the top of the Identify Results panel.

If you had switched to any other "select" tool, nothing would have happened, either with a single right-click or drawing an extent with the right button pressed (I wonder if the latter process is desirable)

Anyway, I think we should either:

- find a way to notify the user that the configs are not good
- or allow the right-click button to ignore the active selection tool and still pops-up the result as if it was a single right-click.
