Pull Request or Patch supplied:		
Easy fix?:	No	
Description		
<p>hello,</p> <p>Point cluster renderer is a great fonctionnality. But I would like to show in cluster (not only the cluster size but attributes that could be aggregated dynamically within the cluster) for example the sum of an attribute for each cluster</p> <p>It should be implemented as a "group by" to be able to use for example <code>sum(nb_passengers, group_by=cluster)</code> to show the number of boarding passengers in a stop area (containing several stop points) . Because often PT stops from serveral lines are very close to each other and proportionnal radius are overlapping.</p> <p>Thanks in advance</p>
