

QGIS Application - Feature request #20076

Heatmap renderer should feature a holding feature or a way to compute the maximum value over a layer

2018-10-11 07:37 AM - vince -

Status:	Open	Resolution: Copied to github as #: 27898
Priority:	Normal	
Assignee:		
Category:	Symbology	
Pull Request or Patch supplied:	No	
Easy fix?:	No	
Description		
<p>The heatmap renderer is a very handy tool, but if the MAX value is set to "automatic", that value is recomputed each time the zoom factor changes, leading to inconsistencies in the way the data is displayed (e.g. dark zones, when zoomed in, become bright) – at least when using a PostGIS layer.</p> <p>Therefore, it would be worth adding a box or something allowing to calibrate the ramp w/r to the layer's maximum instead of taking into account only the displayed area. That would let the user choose between a "global" or a "local" coloring scheme.</p>
