Crashes QGIS or corrupts data:	Yes	Copied to github as #: 27961
Description		
QGIS crashes when using a QgsExternalResourceWidget in the Attribute TableView to edit the String Field value of a QgsVectorLayer (tested in-memory and geopackage) Test-Case: Assume we have a QgsVectorFile with string QgsField "textfield" 1. Layer Properties -> Attribute Forms -> set Widget Type of "textfield" to "Attachment" (activates the QgsExternalResourceWidgetWrapper + Factory) (01_AttributeFormDialog.png) 2. Open Attribute Table View, activate Edit mode and try to edit attribute "textfield" creates an edit widget (02_EditTableView.png) 3. Left-Mouse-click on "..." button opens a "select file dialog" BUT the edit widget disappears meanwhile (03_DisappearedEditWidget.png) 4. Leaving the "select file dialog" (accept/cancel) crashed QGIS Similar behavior was observed for own implementations of QgsEditorWidgetWrappers using QGIS Python API.
