<b>Description</b>		
<p>Sometimes it's better to lay out tables vertically (meaning that the fields are carried in rows not in columns). For example, where there is a only a single polygon (a country, for example) and lots of data to report about it (population, flag, capital, government, GDP, etc..) it looks best to have the fields all listed running down the page with the associated data to the right. At the moment we only have the option of creating a very long table with all the fields horizontally laid out and only one row, which looks bad.</p>
