

QGIS Application - Bug report #20505

Moving a node with vertex tool (current layer) moves identical node in other layers if topological editing is enabled

2018-11-15 01:15 PM - Bernhard Ströbl

Status:	Closed	
Priority:	Normal	
Assignee:		
Category:	Digitising	
Affected QGIS version:	3.4.3	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:		Resolution: invalid
Crashes QGIS or corrupts data:		Copied to github as #: 28325
Description		
Steps to reproduce: <ol style="list-style-type: none">1. Two layers in editing mode, two identical polygons2. both layers visible3. Layer 1 is active, layer 2 is not active4. Vertex tool with current layer mode5. Moving a node does only move it in layer 1 if topological editing is disabled => expected behaviour6. Moving a node does move it in both layers if topological editing is enabled		
IMHO vertices of all layers should only be moved if the vertex tool is in the <i>All-Layers</i> mode, <i>Topological-editing</i> mode ist different from that because it moves common vertices within one layer

I can confirm the error. If I undo the the node moving, it only affects the activated layer. After that I have to undo the process even in the non-activated layer. I have done the tests with QGIS DEV code revision 7cce9b3eb9.

#2 - 2019-01-08 11:25 AM - zimirrr leonid

I confirm the error also. Qgis 3.4.3.

I found out that when selected Vertex Tool(All layers) it moves nodes only in active layer, but when selected Vertex Tool(Current Layer) then it tries to move all found nodes in all layers. I suggest the problem is in icons.

#3 - 2019-01-09 01:10 PM - Giovanni Manghi

- Crashes QGIS or corrupts data changed from Yes to No

- Affected QGIS version changed from 3.4.1 to 3.4.3

#4 - 2019-02-06 12:22 PM - Bernhard Ströbl

- Resolution set to invalid

- Status changed from Open to Closed

Ok, after discussion with Martin [here](#) I do understand this is not a bug but a feature. This is the intended way for the tool to behave. My impression of *current layer* versus *all layers* was, that this decides on which layers I change features by e.g. moving common vertices. In fact it decides on which layers (current versus all) I may interact with.
