

QGIS Application - Bug report #20855

Duplicating a layer with pushing the ctrl-key while dragging, results in a layer that can't be renamed individually

2018-12-20 11:59 AM - Janne Jakob Fleischer

Status:	Open	
Priority:	Normal	
Assignee:		
Category:	Map Legend	
Affected QGIS version:	3.4.1	Regression?: No
Operating System:	Windows	Easy fix?: No
Pull Request or Patch supplied:		Resolution:
Crashes QGIS or corrupts data:		Copied to github as #: 28674
Description		
<p>When duplicating a layer with dragging and pushing the ctrl-key it got duplicated, though when I rename it, the source layer and the copied layer will have the new changed name. I noticed this in 2.18 and also until (my) current QGIS 3.4.1.</p> <p>I think this is only relevant on Windows, while I used this function many times on mac without the doubled renaming (Sadly no Linux here at my ne workplace, so I can't test this).</p>

Oh, also all the properties will be changed for both layers when changing the copy or the origin... Though in the list of the layers the change of symbology is not visible for both layers.
