Easy fix?:	No	
Description		
<p>Currently, we can import a spreadsheet (spatial or non-spatial) with ease. Good stuff.</p> <p>However, the import is quite limited in that it only chooses the first sheet from the object.</p> <p>I'd like to see this behavior improved to have a similar UI/UX to the layer picker when opening geopackages, folders of shapefiles, File Geodatabases, etc. where the list of objects is presented, and you can choose one/some/all/none to import, along with metadata about each feature. Aside from just being consistent, this would make it far easier to work with spreadsheet data without having to constantly subset/export/import the sheets you want at any given time, making it easier to work from a single source document.</p>
