Category:	GUI	
Affected QGIS version:	3.6.2	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:	No	Resolution:
Crashes QGIS or corrupts data:	No	Copied to github as #: 29733
Description		
<p>In the Qt Editor, I add a QgsCollapsibleGrouBox and then add any kind of child widget into the box. Now I set the group box on <i>collapsed</i> state and select the child widget in the object list. When I try to edit the widget's settings (e.g. rename it), after every keyboard input the main form (dockwidget, dialog, mainwindow) gets focus and I have to re-navigate to the widget to proceed editing.</p> <p>For default Qt widgets that can hide their child widgets (QTabwidget, QStackedWidget), the editor unhides the child widget when I start editing them. The behavior described above seems to affect QGIS custom widgets only, that's why I file my bug report here.</p>
