

QGIS Application - Bug report #3024

checkbox edit widget not working + widgets buttons not rendered correctly

2010-09-19 04:32 AM - Giovanni Manghi

Status:	Closed	
Priority:	Low	
Assignee:	Jürgen Fischer	
Category:	GUI	
Affected QGIS version:	master	Regression?: No
Operating System:	OS X	Easy fix?: No
Pull Request or Patch supplied:	No	Resolution: worksforme
Crashes QGIS or corrupts data:	No	Copied to github as #: 13084
Description		
<p>I'm not a OsX user, but a colleague using Leopard shown me that the "Calendar" and "File name" edit widgets are not working. In the table of attribute cells it seems to appear some kind of button, but clicking on it doesn't produce any effect.</p> <p>The package used to install qgis was</p> <p>http://www.kyngchaos.com/files/software/unixport/Qgis-1.5.0-2-Leopard.dmg</p> <p>with all the necessary frameworks.</p>

Calendar? File name?

Some button?

Sorry, all pretty vague.

#2 - 2010-09-20 01:53 PM - Giovanni Manghi

Hi,

I'm referring to "edit widgets" in the vector properties (attributes tab) and how this widgets render and (don't) work when editing in the table of attributes.

Under both linux and windows when you double click the table cell i show a "button" like the ones that are used to browse files in web forms. In the case of the "calendar" widget it opens a window that leave the user choose easily and quick a date.

#3 - 2010-09-22 08:03 AM - zealmeida -

I'm the colleague mentioned above and I'm new to GIS applications, so I apologize in advance for any imprecision in my writing (as in my english...)

It seems to be a problem with the row height. When opening the Attribute table window, if some column as a widget like 'calendar', size when I double clic in toggle editing mode to edit, with the standard cell size I can only see a non editable small blank line. If I extend the row height (extending the column width makes no difference) then the '...' button is visible and I can access the calendar window to choose a date as field contents. It happens the same with the 'file name' widget.

Some screenshots in the attachment (hopefully) will illustrate this.

#4 - 2010-09-22 08:25 AM - William Kyngesburye

My guess is that it's because UI controls (especially buttons) and font sizes are generally a little larger on OS X than other systems. Qgis would have to force a smaller button size here instead of using the system defaults. There are a couple different "standard" sizes in the system, though I know very little about the programming side of Qgis.

So... it is now (again) more clear to me after a "live" test. The "file name" and the "calendar" widgets do work, while the buttons in the table of contents are rendered in a way that force the user to resize vertically each row in order to see a clickable button.

Meanwhile we discovered that the "checkbox" button, aside the same problem above described, does really not work.

Replying to [comment:5 lutra]:

Meanwhile we discovered that the "checkbox" button, aside the same problem above described, does really not work.

How does it not work? So far, I tried setting a field to the checkbox type, and I do get broken behavior: it doesn't save checked/unchecked state values in the configuration, and no checkbox shows up in the table, no matter how tall I make the row. Is this what you mean?

How does it not work? So far, I tried setting a field to the checkbox type, and I do get broken behavior: it doesn't save checked/unchecked state values in the configuration, and no checkbox shows up in the table, no matter how tall I make the row. Is this what you mean?

In the system I tested the checkbox show in the table cell (but you still need to resize vertically the row to see it fine) but then clicking on it does not produce any effect, the checkbox remains unchecked.

Hi

I added a small screencast that may help to understand the problem. When using the attribute table window, a double clic to edit opens the checkbox but doesn't allow to check, so the value in the field is always the unchecked one. When creating a new object (in this example a polygon) I'm able to check it, but again in the attribute table window I can make no changes.

The Mac Qgis 1.5 and 1.6 used Qt 1.6. As noted above, calendar works only if the row is resized to be a couple times larger than default (it looks like the widget has a large buffer), and checkbox displays but does nothing at all.

With Qt 4.7 in QGIS trunk, at least the calendar and other widgets display without resizing. But now the calendar widget does nothing. That brings the list to calendar, filename and checkbox not working at all.

#10 - 2011-12-16 01:55 PM - Giovanni Manghi

- Target version changed from Version 1.7.0 to Version 1.7.4

#11 - 2012-04-16 06:24 AM - Paolo Cavallini

- Target version changed from Version 1.7.4 to Version 1.8.0
- Affected QGIS version set to master
- Crashes QGIS or corrupts data set to No

#12 - 2012-09-04 12:02 PM - Paolo Cavallini

- Target version changed from Version 1.8.0 to Version 2.0.0

#13 - 2014-06-20 03:07 AM - Giovanni Manghi

- Resolution set to worksforme
- Status changed from Open to Closed
- Pull Request or Patch supplied set to No

I don't have a Mac to test and a long time has passed, I can just assume that this is not a issue anymore.
