Crashes QGIS or corrupts data:		**Copied to github as #:**	14792	

Description

Running master (14/2/2012) I have a problem with the identify map tool.

If I run it in the normal modus it works ok (for this postgis layer), but if I run it in the modus 'Open feature form, if a single feature is identified' from the Maptools tab in the Options. I get the wrong results.

To reproduce:
- loaded attached shape in postgis via SPIT plugin (using epsg:28992 as CRS)
- load the layer in QGIS
- using the identify tool in normal modus: every point shows you city information
- uding the identify tool in 'open feature form' modus, a form is opened, but it is showing the wrong information. It shows the feature with apparently gid 1
