

QGIS Application - Feature request #5046

georeferencer/construct of control points with intersection lines

2012-02-18 09:11 AM - Hans-Peter Klossek

Status:	Open	Resolution: Copied to github as #: 14816
Priority:	Normal	
Assignee:		
Category:	C++ plugins/Georeferencer	
Pull Request or Patch supplied:		
Easy fix?:	No	
Description		
<p>Hello, for an archaeological project I'm rectifying aerial photographs with the georeferencer. But sometime I have the problem that I have not enough GCPs. So I need a tool to construct GPCs with intersection of straight lines (along dirtroads, streets, field edges aso.) in both views (GIS-map and georeferencer window).</p> <p>I would be happy if you would take up this idea in your development of the georeferencer.</p> <p>Best regards</p>

you can compute intersection points with the proper tool in the "vector" menu and then use them as GPCs. Is enough?

#2 - 2012-02-18 10:32 AM - Hans-Peter Klossek

Thank you for your fast answer,

but I think it will not help me. I need the intersection lines in both views to construct GPCs. In the georeferencer window and in the map window.

There is a software, called Percor, that can this, but this is not a GIS and I can't use WMS maps aso.

This is a description of Percor: http://www.uni-koeln.de/~al001/percor_files/hs500.htm

Best regards, Hape

- Operating System deleted (Windows 7)

- Target version changed from Version 1.7.4 to Version 2.0.0

If you need something more please evaluate supporting its development. Cheers.

In the QGIS site you find a page where are listed companies that do offer commercial support (and development and bug fixing)

<http://www.qgis.org/en/commercial-support.html>

You may want to give a look also here

<https://issues.qgis.org/wiki/quantum-gis/Bugs>
