Affected QGIS version:		**Regression?:**	No
Operating System:	Debian	**Easy fix?:**	No
Pull Request or Patch supplied:		**Resolution:**	worksforme
Crashes QGIS or corrupts data:		**Copied to github as #:**	10586

Description

I have read that this bug is supposed to be fixed, but the Georeferencer plugin still doesn't seem to display an unreferenced TIFF or JPEG raster. For that matter, it doesn't display a referenced TIFF either. The display remains black. I am using the 0.8.0 binary on Mac OS X 10.3.9.

Does it work when you turn projection off?

The fix you mention was checked in 7 days ago, I do not believe the Mac binary includes this fix.

It works when turning off projection. In 0.8.1 it should work with projection turned on also.
