

QGIS Plugin Site - Bug report #5934

Regex fails to detect qgisMinimumVersion in __init__ because regex wants all returns to be quoted

2012-07-03 11:35 PM - Tim Sutton

Status:	Closed	
Priority:	Normal	
Assignee:	Alessandro Pasotti

Pull Request or Patch supplied:		

Description

If the *init* file first computes the return value in a var and then returns the var, the validator.py regex at line 30 fails to return any further key value pairs. See below for an example:

Fails:

```
def icon():
    """Icon path for the plugin - metadata.txt it will override this"""
    myPath = os.path.join(os.path.dirname(__file__), 'gui', 'resources',
                          'img', 'icon.png')
    return myPath

def qgisMinimumVersion():
    """Minimum version of QGIS needed to run this plugin - currently set to 1.7."""
    return '1.7'
```

This works:

```
def icon():
    """Icon path for the plugin - metadata.txt it will override this"""
    return os.path.join(os.path.dirname(__file__), 'gui', 'resources',
                       'img', 'icon.png')

def qgisMinimumVersion():
    """Minimum version of QGIS needed to run this plugin - currently set to 1.7."""
    return '1.7'
```

It's not a bug, it's a "feature" :)

If you have a better solution than parsing init with regexps, please give your advice.

#2 - 2012-07-04 05:18 AM - Tim Sutton

I should have added that for me the desired behaviour would be to continue to fetch readable metadata in the event that a particular function's return

cannot be parsed.

Yes I agree loading the *init* using python is bad - using regexps is good. I tried to manipulate the regex to account for the fact that in some cases the return data is not a quoted string and to skip it, but I couldn't find a neat way to do it yet.

Today I uploaded the new *init.py* parser, it should be more robust than before but it still doesn't import python (for the well know security reasons).

Given the fact that *init.py* usage is deprecated I'm closing this bug with wontfix.
