Description

The "edit widget" dialog uses a combobox to select the type of edit widget to use for each attribute field.
To reduce the number of clicks necessary when setting up all the edit widgets for a layer, it would be nice if a list view or something was used instead of a combobox.
See the attached mockup.

I agree. We could reduce the size of the list on the side a little to save on space.

I don't think there would be much coding in this as a listbox is the same as a combobox in terms of function. Do you already have a diff, or do you want me to have a look into it.
