QGIS Application - Feature request #7081

Command line option to read project but not actually loading the layers

Easy fix?:
Description

When a problem occurs in a complex project, it is hard to find out the culprit layer(s) with a simple editor.

A command line option could exist that would read the layers to the Layers (aka TOC) panel but actually only load the layer when right click load. In this way, it would be much easier identifying the problematic layer(s) and remove it/them from the project.
