Crashes QGIS or corrupts data:		**Copied to github as #:**	16245

Description

With QGIS 1.8 I'm able to create a project with layers from a tileacache server and then serve them as normal WMS layer with QGIS server.

In QGIS master this stopped to work.

A server you can test is http://mapas.igeo.pt/tilecache/tilecache.py (offline) or OpenGeo WMTS

be sure to check both the "ignore getmap..." and "ignore getfeatureinfo..." checkboxes and consider that the layers in this server are visible only starting from certain scales.
