Description			
when I created the git repository for the colorrampmanager plugin, a network error occurred and the repository is somehow corrupt. <pre>\$ git push gitosis@qgis.org:colorrampmanager.git master ERROR:gitosis.serve.main:Repository read access denied fatal: The remote end hung up unexpectedly</pre> I have read and write access to other plugin repositories on qgis.org, so it is not an access problem. Can someone please fix the problem, or remove the repository so I can re-create it? I do not know who has actual access to the server.
