Affected QGIS version:	2.0.1	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:	No	Resolution:
Crashes QGIS or corrupts data:	No	Copied to github as #: 17393
Description		
Hi. I found this really bad boring bug. If a put my svg symbol in a sub-sub-folder of an external path (please notice the proof of subfolder should be almost two level to show the bug) I see thay in the svg dialog. I choose a symbol in a sub-sub-folder. After this. I save it on a style. As I can see the svg path in the qml file is saved like this: <pre><layer pass="0" class="SvgMarker" locked="0"> <prop k="angle" v="0"/> <prop k="fill" v="#000000"/> <prop k="name" v="/sub-folder-1/sub-folder-1/3100-9.svg"/> <prop k="offset" v="0,0"/> <prop k="offset_unit" v="MM"/> <prop k="outline" v="#000000"/> <prop k="outline-width" v="1"/> <prop k="outline_width_unit" v="MM"/> <prop k="size" v="4"/> <prop k="size_unit" v="MM"/> </layer></pre> But when I go to reload the style It don't find the SVG. After some other test. I can see that qgis undertand only one level subfolder when it load the sty. So if the SVG symbol is in a relative path like this: <pre><prop k="name" v="/sub-folder-1/3100-9.svg"/></pre> is correctly load but if the svg symbol is in a relative path like this other: <pre><prop k="name" v="/sub-folder-1/sub-folder-1/3100-9.svg"/></pre> it is not load. Please notice that both are generate choosing the svg from svg diloag and saving they as style.
