

## QGIS Application - Bug report #9937

### Symbol outline width incorrect when set to 0

<b>Description</b>		
<p>The standard point symbols have a black outline. The dialog displays an outline width of 0 but clearly and outline is still displayed. Changing the outline size to 0.01 results in a much thinner line than when set to 0. The width of the outline when set to 0 resembles the result of choosing 0.2. To completely remove the outline, the user has to select "no pen". I think setting to 0 should have the same effect as "no pen".</p>

Actually what is happening is that setting a zero-width outline is equivalent to a "hairline" width in most drawing programs. It means the outline is always drawn so that it's 1 pixel wide, regardless of any zoom/resolution settings.

This is a pretty important feature to have, and I'd hate to see it dropped. It should be exposed to the user in a better way though. Any ideas?

I see. Then we should set a reasonable value for "hairline". Currently it's much too wide.

**#3 - 2016-04-10 02:29 PM - R. R.**

As for simple lines and borders (simple fill), the default width should be 0,26mm.
